

THOTA GANESH

thotaganesh737@gmail.com

Mobile: +91 7995543256

Professional Summary:

- Python Developer with 4+ years of experience, mainly focused on backend development, APIs, and cloud-based applications.
- Skilled in Python, using Flask and Django REST, and experienced with ReactJS for building user interfaces.
- Basic knowledge of frontend technologies like HTML, CSS, and JavaScript.
- Hands-on experience using AI and ML tools, such as OpenAI API, Hugging Face, Scikit-learn, and Spacy.
- Strong background in database (PostgreSQL).
- Helped build legal tech platforms that use AI for document automation and smart assistants.
- Worked on full-stack projects, from designing databases to building APIs and frontend interfaces.
- Built ETL pipelines to move and clean the data using Python and Pandas.
- Experienced in Agile teams, using tools like Git, Postman, VS Code, and PyCharm.

Tools and Technologies:

Category	Skills
Programming Languages	Python, React Js, JavaScript, pandas
Databases	MySQL, PostgreSQL, MSSQL
Web Technologies	HTML, CSS, RESTful APIs
Frameworks	Flask, Django REST Framework
AI/ML Tools	OpenAI API, Hugging Face, Scikit-learn, Spacy, Pandas, NumPy
ID/ Other Tools	VS Code, PyCharm, Git, Postman
Development Concepts	Microservices, Data Processing, AI Integration, ETL Pipelines

Work Experience:

Currently working as a Software Engineer at Techoptima Pvt Ltd, Hyderabad (June 2022 – Present)

Projects:

Project Name: Content Management System (CMS)

Duration: December 2025 – March 2025

Project Description:

Created a Content Management System (CMS) using Django to help users add, edit, and publish blog content without needing to know how to code. The system includes an easy-to-use admin panel for managing content, images, and categories. It helps teams work faster, keep content organized, and maintain a consistent look. The system also includes secure login and different user roles for better control.

Roles and Responsibilities:

- Built REST APIs using Django REST Framework to manage blog posts, categories, and users.
- Designed the database using PostgreSQL with proper links between blog posts and other data.
- Set up token-based login to keep the system secure.
- Added different user roles (like editor and admin) to control who can do what.
- Added checks to make sure the data entered is correct and showed clear error messages.
- Handled file uploads like images and organized them in folders.
- Wrote clean, reusable code by following Django's best practices.
- Tested features and fixed bugs to keep everything working smoothly.
- Wrote simple documentation to help others understand how to use and set up the system.

Project Name: OptHub

Duration: June 2024 – November 2024

Project Description:

OptHub is a content-sharing platform that lets users post to multiple social media platforms (like Facebook, Twitter, LinkedIn, etc.) with just one click. It also includes an AI-powered chatbot that helps users generate content such as blog posts, captions, and social media updates. This makes it easy and fast for users to create and share content without switching between platforms.

The system was built using **Python** for the backend, **React.js** for the frontend, and **PostgreSQL** as the database.

Roles and Responsibilities:

- Developed the backend using Python and managed data with PostgreSQL.
- Integrated an AI chatbot to help users create content like posts, blogs, and captions.
- Built features for one-click posting to multiple social media accounts.
- Worked closely with the frontend team (React.js) to ensure smooth and responsive user experience.
- Handled overall project coordination, planned features, and ensured timely delivery.

Project Name: Data Migration System

Duration: May 2023 – August 2023

Project Description:

Built a backend system to safely move large and complex sets of data between different types of databases. The system cleaned, converted, and checked the data using ETL (Extract, Transform, Load) pipelines, making it ready for reporting, analysis, and daily business use.

Roles and Responsibilities:

- Created data pipelines using Python, Pandas, and MSSQL to move data from old systems to new ones.
- Wrote reusable code to handle file formats like CSV and other structured data.
- Built simple web services using Flask and REST APIs to start and monitor data transfers.
- Added error checks to find and fix data issues during migration for better accuracy.
- Handled large files in smaller parts (chunks) to improve performance and reduce memory use.
- Set up logging and tracking to monitor each batch of data and make the process easy to review.
- Worked with business teams to understand how data should be cleaned and organized.
- Helped write documentation on how the pipeline works and how to fix common issues.

Education

B.Tech in Electrical and Electronics Engineering

Graduated in 2021
